## ABOUT THE FUND

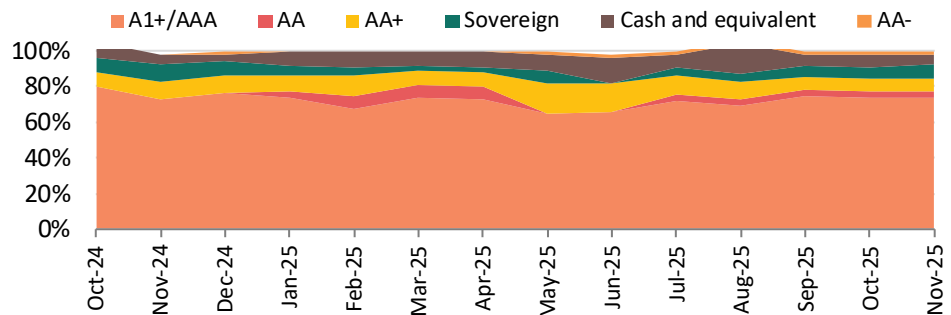

- Baroda BNP Paribas Low Duration Fund invests in fixed income instruments such that Macaulay duration of scheme is between 6 - 12 months.
- The short maturity profile of the fund helps to reduce the sensitivity of the portfolio to changing interest rate scenarios.
- The scheme aims to invest in a prudent mix of debt securities, money market instruments and government securities to generate capital appreciation. The portfolio construction process follows a stringent internal credit policy framework with the endeavor to invest in papers of high credit quality. Thus it aims to offer short maturity, high liquidity and moderate credit risk.
- The scheme is suitable for investors with investment horizon of 6-12 months to park their idle or surplus money.

## PORTFOLIO POSITIONING

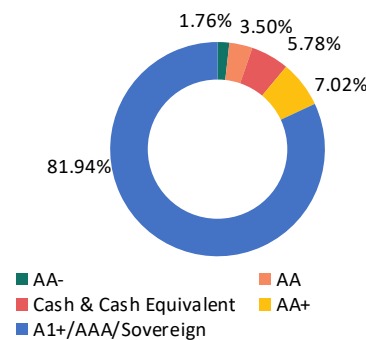

- The primary objective of the Scheme is to provide income consistent with the prudent risk from a portfolio comprising of investment in Debt & Money Market instruments such that the Macaulay duration of the portfolio is between 6 months - 12 months
- The Fund continues to maintain high credit quality by investing more than 80% in AAA/Sov assets.
- We expect liquidity surplus to remain comfortable supported by (1) G-sec redemption of ~Rs1 tn, (2) third tranche of CRR rate cut and (3) continued government spending.
- The Fund intends to position its mac duration at higher end on the duration band with a barbell strategy by allocating higher maturity bonds/sovereign assets.

Relatively High: Class III (Any MD)		B-III	

MD=Macaulay Duration, CRV=Credit Risk Value.

The above PRC matrix denotes the maximum risk that the Scheme can take i.e. maximum interest rate risk (measured by MD of the scheme) and maximum credit risk (measured by CRV of the scheme).

### DISCLAIMERS

**\* Concept of Macaulay duration** - The Macaulay Duration is a measure of a bond’s sensitivity to interest rate changes. It is expressed in annual terms. It is the weighted average term to maturity of the cash flows from a bond. The weight of each cash flow is determined by dividing the present value of the cash flow by the price. Factors like a bond’s price, maturity, coupon, yield to maturity among others impact the calculation of Macaulay duration. The Macaulay duration can be viewed as the economic balance point of a group of cash flows. Another way to interpret the statistic is that it is the weighted average number of years an investor must maintain a position in the bond until the present value of the bond’s cash flows equals the amount paid for the bond. As it provides a way to estimate the effect of certain market changes on a bond’s price, the investor can choose an investment that will better meet his future cash needs.
