## ABOUT THE FUND

- Baroda BNP Paribas Short Duration Fund invests in fixed income instruments such that the Macaulay Duration of the portfolio is between 1 to 3 years.
- The Scheme aims to invest in a mix of high quality instruments at the shorter end of the yield curve. These may be commercial paper (CP), certificate of deposit (CDs), government securities, securities issued by private or public sectors companies, etc. The portfolio also aims to offer high liquidity along with moderate duration risk.
- The Scheme remains open to taking tactical duration calls.
- While investing in fixed income instruments, the scheme takes into account various factors affecting the Indian economy, interest rate scenario, and the relative valuation, maturity profile and liquidity of the securities, etc.
- The Scheme is suitable for short term investment horizon.

## PORTFOLIO POSITIONING

- While the RBI has continued to conduct Variable Rate Reverse Repo (VRRR) auctions, the weighted average overnight Rates have continued to trade below repo rate due to surplus liquidity.
- We expect liquidity to remain surplus even after maturity of \$5Bn Fx Buy/sell swap and the indirect tax and GST outflow
- Neutral Stance by RBI indicates the market that the operational overnight rate may remain closer to repo rate.
- Corporate bonds (up to 5yr) spreads remain at the higher end of the range and provide an opportunity on risk reward basis.
- We remain invested ~80%-85% in AAA rated and Sovereign instruments and balance in AA/AA+ rated good quality assets as it offers attractive spread over Government bonds.
- We remain invested in corporate bonds ranging from short to medium term maturities (2 to 5yr) across ratings.
- We intend to keep the duration at the higher levels, near to 2.50-3.00 years and the scheme remains open to taking tactical duration calls.
- we remain invested in PTCs rated AAA (SO) as well as PSU bonds to enhance the YTM's and benefit from portfolio diversification

Income Distribution cum Capital Withdrawal (IDCW) HISTORY (Regular Plan - IDCW Option)

Record Date	Distribution Rate Per Unit (₹) Individual/others	Cum —IDW C NAV (₹)
27-May-25	0.06	10.46
27-Jun-25	0.06	10.41
28-Jun-25	0.06	10.42

Last 3 IDCW declared for IDCW option.  
Pursuant to distribution under Income Distribution cum Capital Withdrawal ('IDCW') option, NAV of the IDCW option of the scheme(s) would fall to the extent of pay-out and statutory levy (if applicable). The amounts under IDCW options can be distributed out of investors' capital (Equalization Reserve), which is part of sale price that represents realized gains. **Past performance may or may not be sustained in future and is not a guarantee of any future returns.** The above stated distribution rate per unit is net distribution rate after deducting applicable taxes. The above distribution rates are on face value of Rs 10 per unit. Face value may change depending upon FV of the scheme.

## Product Labelling

### <sup>^</sup>Concept of Macaulay duration:

The Macaulay Duration is a measure of a bond's sensitivity to interest rate changes. It is expressed in annual terms. It is the weighted average term to maturity of the cash flows from a bond. The weight of each cash flow is determined by dividing the present value of the cash flow by the price. Factors like a bond's price, maturity, coupon, yield to maturity among others impact the calculation of Macaulay duration.

Potential Risk Class (PRC) matrix*			
Credit Risk (Max)→	Relatively Low: Class A (CRV>=12)	Moderate: Class B (CRV>=10)	Relatively High: Class C (CRV<10)
Interest Rate Risk (Max)↓			
Relatively Low: Class I (MD<=1 year)			
Moderate: Class II (MD<=3 year)			
Relatively High: Class III (Any MD)		<b>B-III</b>	

MD=Macaulay Duration, CRV=Credit Risk Value.

The above PRC matrix denotes the maximum risk that the Scheme can take i.e. maximum interest rate risk (measured by MD of the scheme) and maximum credit risk (measured by CRV of the scheme)

## DISCLAIMERS

<sup>†</sup> Concept of Macaulay duration: The Macaulay Duration is a measure of a bond's sensitivity to interest rate changes. It is expressed in annual terms. It is the weighted average term to maturity of the cash flows from a bond. The weight of each cash flow is determined by dividing the present value of the cash flow by the price. Factors like a bond's price, maturity, coupon, yield to maturity among others impact the calculation of Macaulay duration. The Macaulay duration can be viewed as the economic balance point of a group of cash flows. Another way to interpret the statistic is that it is the weighted average number of years an investor must maintain a position in the bond until the present value of the bond's cash flows equals the amount paid for the bond. As it provides a way to estimate the effect of certain market changes on a bond's price, the investor can choose an investment that will better meet his future cash needs.
